## EXPERIENCE

### State Farm

**Lead Software Engineer** | November 2024 - Present
**Software Engineer II** | October 2022 - November 2024

Lead frontend development for customer-facing life insurance applications covering policy servicing and digital claims across 10 policy types. Roughly 128,000 user actions per month.

- Led frontend delivery of an in-house beneficiary change flow to replace an off-site vendor experience. Shipped simpler changes first to reduce manual handling, then expanded to estates, trusts, and organizations, enabling retirement of the vendor contract.
- Migrated both applications from Create React App to Vite and from React 18 to 19. Observed about 40% lower p75 page load in the 30 days after the Vite release compared with the preceding 30 days.
- Mentor six engineers through design and code reviews; interviewed 10+ candidates and onboarded four.
- Consolidated four flows across two repositories into a shared structure that now supports nine.
- Led TypeScript and corporate design-system migration for policy servicing, released August 2026.
- Built automated checks for types, tests, and design-system compatibility; led accessibility fixes from company audits.
- Helped plan AI adoption across Engineering and Technology, including coding agents and MCP servers. Co-developed AGENTS.md project guidance and reusable agent skills, and trained engineers to apply them and establish development guardrails.

### Microsoft

**Engineer I, Detection and Abuse Analysis** | November 2019 - October 2022

- Analyzed false positives, missed detections, and emerging abuse patterns. Shared findings with architects to help refine detection algorithms.
- Built the team's onboarding program, trained every new hire, and led team reviews of difficult cases.

### WattTime

**Software Engineer, Senior Capstone Project** | September 2019 - June 2020

- Built Python scrapers to collect emissions data into a shared SQL database, and a React dashboard for exploring trends by time and geography.

## SELECTED PROJECT

**finledger** | Source | Demo

Built a Python pipeline and JavaScript dashboard that turn broker CSV exports into a portfolio view, calculate cost basis, track tax lots, and reconcile results against broker tax statements. Runs locally, with nine broker parsers and over a thousand tests.

## SKILLS

**Frontend:** TypeScript, JavaScript, React, Redux, HTML, CSS, Vite, Vitest, Testing Library
**Backend and data:** Java, Spring, Python, Node.js, REST APIs, SQL
**Delivery:** Docker, AWS, Kubernetes, CI/CD, Git
**Engineering:** Frontend architecture, API design, accessibility, automated testing, mentoring

## EDUCATION

**Bellevue College** | B.S. Computer Science, 2020
**Evergreen State College** | B.A. Philosophy, 2014
